

AutoClimber

User Guide

Installation, quick setup, modes, controls, and everyday use

Version 1.2.0 | Tashi

AutoClimber automatically completes Idle Slayer's Ascending Heights minigame. It plans a safe route across the live platform layout, uses super-jump pads, recovers from difficult landings, and continues through the real finish line.

This guide is for players who want to install the mod and start using it. For technical behavior, every setting, and detailed diagnostics, see the Complete Manual.

What AutoClimber Does

- Supports practice, 1,000-point, and 2,000-point Ascending Heights layouts.
- Detects normal, moving, fragile, strong, golden, and finish platforms.
- Prioritizes reliable completion and valuable super-jump platforms.
- Keeps moving after the displayed score threshold until the real exit is reached.
- Can touch nearby Ascending Heights enemies when the detour remains safe.
- Can collect Frozen Shards and other rewards available during the full climb.
- Supports background control while the game window is unfocused.
- Can retry after failure or choose No and leave automatically.

AutoClimber remains dormant outside Ascending Heights.

Installation

Idle Slayer Mod Manager (recommended)

- 1 Install and initialize Idle Slayer Mod Manager.
- 2 Install Idle Slayer Mods Core.
- 3 Import the AutoClimber ZIP without extracting it.
- 4 Enable AutoClimber and start the game.

Manual installation

Place `AutoClimber.dll` in:

```
%LOCALAPPDATA%\IdleSlayerModManager\ModLoader\Mods\
```

Do not place the DLL directly in the Idle Slayer game directory.

Default Control

Key	Action
Y	Enable or disable AutoClimber

The key can be changed in `AutoClimber.cfg`. An in-game notification confirms whether automation is enabled or disabled.

Recommended First Setup

- 1 Launch the game once so the configuration file is created.
- 2 Leave `Mode` = "Normal" for full completion, enemies, and rewards.
- 3 Leave `Target Enemies` = `true` if you want safe enemy collection.

- 4 Decide whether failed challenges should retry automatically.
- 5 Enter Ascending Heights; no additional input is required.

Choosing a Mode

Mode	Behavior
Normal	Always plays the complete route. Recommended for general use, enemies, and rewards.
Auto	Plays the full route only when an incomplete quest requires an Ascending Heights enemy; otherwise uses Skip.
Skip	Uses a separate short route for fast completion and may bypass enemies and climb rewards.

The Auto decision is made before each minigame run and stays fixed for that run. Missing or uncertain quest data does not force an unsafe Skip decision.

Platforms and Completion

AutoClimber treats platforms as landing areas rather than points. It predicts moving-platform positions, gives fragile platforms a lower safety preference, and uses strong or golden super-jump platforms when they provide a safe route.

The displayed score is not treated as proof of completion. The mod waits for the spawned finish platform, lands on it, stabilizes, and then keeps moving right until the real exit is triggered. This applies to practice and full challenges.

Enemy Targeting

When `Target Enemies = true`, AutoClimber may adjust an airborne path or choose another safe platform to touch a detected enemy. Completion and super-jump platforms retain priority. An enemy is intentionally skipped when pursuing it would make the route meaningfully less reliable.

Enemy targeting is best-effort, not a promise to defeat every enemy.

Failure and Retry

- With `Auto Retry Enabled = true`, the mod selects Continue Challenge after a failed run.
- With it set to `false`, the mod selects No and exits the retry prompt.
- A revived run is tracked separately so the summary can distinguish first- life completion from completion after revival.

Configuration File

Launch the game once to create:

```
%LOCALAPPDATA%\IdleSlayerModManager\ModLoader\UserData\AutoClimber.cfg
```

Default user settings:

```
[AutoClimber]
"Debug Mode" = false

[Automation]
Mode = "Normal"
```

```
"Enabled On Startup" = true
"Toggle Key" = "Y"
"Auto Retry Enabled" = false
"Skip Start Slider" = true
"Target Enemies" = true
```

Save changes and restart the game so every setting is loaded consistently. See the Configuration Reference for details.

Run Summary

Full-route runs always produce a compact summary similar to:

```
Run summary: total=10; success=9; failure=1; passRate=90.0%; lastResult=success; durationSeconds=132.40;
enemiesDetected=20; enemyHits=9.
```

Skip runs are excluded from normal route statistics and detailed route debug output so they do not distort full-route reliability data.

Quick Troubleshooting

Nothing happens in Ascending Heights

Press the configured toggle key and confirm the enabled notification. Check that `Enabled On Startup` is true if you expect automation immediately.

The mod takes a route that misses an enemy

Confirm `Target Enemies = true`. The enemy may have been rejected because the detour was unsafe or conflicted with a better platform.

The score is complete but the character keeps moving

This is intentional until the real finish platform and exit are confirmed. If the character remains stuck at the top, enable Debug Mode and keep the relevant MelonLoader log.

The mod chose Skip unexpectedly

Check Mode. Auto uses Skip unless a supported incomplete Ascending Heights enemy quest is positively detected before the run.

For more help, see Troubleshooting and Logging and Statistics.

Full Automation Suite

- AutoAdventurer handles active gameplay, quest selection and travel, Rage, movement abilities, Bonus helpers, and bosses.
- AutoProgression handles purchases, Ascension, craftables, materials, eggs, and quest claiming.
- AutoClimber handles Ascending Heights routes, enemies, and rewards.

Each mod works independently. Together, they automate complementary parts of Idle Slayer.
